Shock Waves

Normal Shock Wave
(The airstream slows to subsonic)

Oblique Shock Wave
(The airstream slows down, but remains supersonic)

Expansion Wave
(The airstream accelerates, and the air behind the shock wave has higher supersonic)

Review of Quasi-1D Nozzle Flow

Liquid Rocket Engine

Glenn
Research
Center

$$\text{Thrust} = F = \dot{m} V_e + (p_e - p_0) A_e$$

Review of Quasi-1D Nozzle Flow

Assuming:

- **steady**
- **inviscid**
- **no body forces**

Quasi-1D:

- **Area is allowed to vary but flow variables are a function of x only**

Mass conservation

$$\iiint_V \frac{\partial \rho}{\partial t} dV + \iint_S \rho \bar{U} \cdot \bar{n} dS = 0$$

Momentum conservation

$$\frac{\partial}{\partial t} \iiint_V \rho \bar{U} dV + \iint_S \rho (\bar{U} \cdot \bar{n}) \bar{U} dS = - \iint_S p dS + \iiint_V \rho \bar{f} dV + F_{viscous}$$

Energy conservation

$$\frac{\partial}{\partial t} \iiint_V \rho \left(e + \frac{U^2}{2} \right) dV + \iint_S \rho \left(e + \frac{U^2}{2} \right) \bar{U} \cdot \bar{n} dS = - \iint_S p \bar{U} \cdot \bar{n} dS + \iiint_V \rho \frac{\partial q}{\partial t} dV + \iiint_V \rho (\bar{f} \cdot \bar{U}) dV$$

Review of Quasi-1D Nozzle Flow

Assuming:

- steady
- inviscid
- no body forces

Quasi-1D:

- Area is allowed to vary but flow variables are a function of x only

$$\iiint_V \frac{\partial \rho}{\partial t} dV + \iint_S \rho \bar{U} \cdot \bar{n} dS = 0$$

$$-\rho u A + (u + du)(\rho + d\rho)(A + dA) = 0$$

$$-\cancel{\rho u A} + \cancel{\rho u A} + \rho u dA + \rho du A + d\rho u A + \text{higher order terms} = 0$$

$$\rho A u = \text{Const.}$$

$$\frac{dA}{A} + \frac{d\rho}{\rho} + \frac{du}{u} = 0$$

Review of Quasi-1D Nozzle Flow

Assuming: steady; inviscid; no body forces

Quasi-1D:

- Area is allowed to vary but flow variables are a function of x only

Momentum conservation

$$\frac{\partial}{\partial t} \iiint_V \rho \bar{U} dV + \iint_S \rho (\bar{U} \cdot \bar{n}) \bar{U} dS = - \iint_S p dS + \iiint_V \rho \bar{f} dV + F_{viscous}$$

$$-\rho u^2 A + (\rho + d\rho)(u + du)(u + du)(A + dA) = PA - (P + dP)(A + dA) + 2\left(\frac{PdA}{2}\right)$$

$$-\cancel{\rho u^2 A} + \cancel{\rho u^2 A} + \rho u^2 dA + u^2 Ad\rho + \rho u A du + \rho u A du = \cancel{PA} - \cancel{PA} - PdA - AdP + PdA$$

$$u(\cancel{\rho u dA} + \cancel{u Ad\rho} + \rho A du) + \rho u A du = -AdP$$

$$dP = -\rho u du \quad \Rightarrow \quad \frac{dP}{\rho} = \frac{dP}{d\rho} \frac{d\rho}{\rho} = -u du \quad \left(a^2 = \frac{dP}{d\rho} \right)_s \quad \Rightarrow \quad \frac{d\rho}{\rho} = -\frac{u}{a^2} du$$

Since:

$$\frac{dA}{A} + \frac{d\rho}{\rho} + \frac{du}{u} = 0 \quad \Rightarrow \quad \frac{dA}{A} + \frac{du}{u} - \frac{u}{a^2} du = 0$$

$$\Rightarrow \frac{dA}{A} + \frac{du}{u} \left(1 - \frac{u^2}{a^2} \right) = \frac{dA}{A} + \frac{du}{u} (1 - M^2) = 0 \quad \Rightarrow \quad \frac{dA}{A} = (M^2 - 1) \frac{du}{u}$$

Review of Quasi-1D Nozzle Flow

$$\frac{dA}{A} = (M^2 - 1) \frac{du}{u}$$

Subsonic flow
($Ma < 1$)

$$dA > 0$$

Review of Quasi-1D Nozzle Flow

Isentropic relation:

$$\frac{P_2}{P_1} = \left(\frac{\rho_2}{\rho_1}\right)^\gamma = \left(\frac{T_2}{T_1}\right)^{\frac{\gamma}{\gamma-1}}$$

Energy Equation:

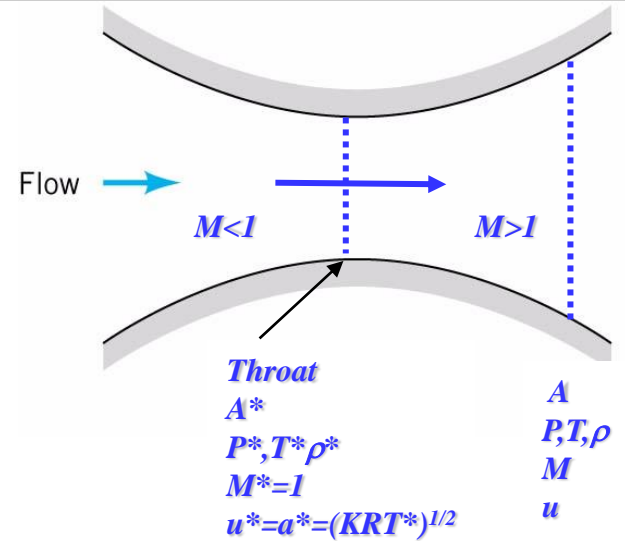

$$C_p T_0 = C_p T + \frac{V^2}{2}$$

$$\Rightarrow \frac{T_0}{T} = 1 + \frac{V^2}{2C_p T} = 1 + \frac{\gamma-1}{2} \frac{V^2}{\gamma RT}$$

$$\frac{T_0}{T} = 1 + \frac{\gamma-1}{2} M^2$$

$$\frac{P_0}{P} = \left(1 + \frac{\gamma-1}{2} M^2\right)^{\frac{\gamma}{\gamma-1}}$$

$$\frac{\rho_0}{\rho} = \left(1 + \frac{\gamma-1}{2} M^2\right)^{\frac{1}{\gamma-1}}$$

$$\left(\frac{A}{A^*}\right)^2 = \frac{1}{M^2} \left[\frac{2}{\gamma-1} \left(1 + \frac{\gamma-1}{2} M^2\right) \right]^{\frac{\gamma+1}{\gamma-1}}$$

1st, 2nd and 3rd critic conditions

P_0 increasing

P_0 increasing

1st, 2nd and 3rd critic conditions

Under-expanded flow

Flow close to 3rd critical

Over-expanded flow

2nd critical – shock is at nozzle exit

Over-expanded flow with shock between nozzle exit and throat

1st critical – shock is almost at the nozzle throat.

Method #1: Prediction of the Pressure Distribution within a De Laval Nozzle by using Numerical Approach

- Using the area ratio, the Mach number at any point up to the shock can be determined:

$$\left(\frac{A}{A^*}\right)^2 = \frac{1}{M^2} \left[\frac{2}{\gamma+1} \left(1 + \frac{\gamma-1}{2} M^2 \right) \right]^{\frac{\gamma+1}{\gamma-1}}$$

- After finding Mach number at front of shock, calculate Mach number after shock using:

$$M_2^2 = \frac{1 + \frac{\gamma-1}{2} M_1^2}{\gamma M_1^2 - \frac{\gamma-1}{2}}$$

- Then, calculate the A_2^*

$$\left(A_2^*\right)^2 = M_2^2 A_s^2 \left[\frac{2}{\gamma+1} \left(1 + \frac{\gamma-1}{2} M_2^2 \right) \right]^{\frac{\gamma+1}{\gamma-1}}$$

which allows us calculate the remaining Mach number distribution

$$\left(\frac{A}{A_2^*}\right)^2 = \frac{1}{M^2} \left[\frac{2}{\gamma+1} \left(1 + \frac{\gamma-1}{2} M^2 \right) \right]^{\frac{\gamma+1}{\gamma-1}}$$

- d. To calculate Mach number given the Mach-Area relation, can use Newton iteration to find M

$$F = \left(\frac{A}{A^*}\right)^2 = M^2 \left[\frac{2}{\gamma+1} \left(1 + \frac{\gamma-1}{2} M^2 \right) \right]^{\frac{\gamma+1}{\gamma-1}} \quad (2.8)$$

$$F' = \frac{dF}{dM} = \frac{2}{M^3} \left[\frac{2}{\gamma+1} \left(1 + \frac{\gamma-1}{2} M^2 \right) \right]^{\frac{\gamma+1}{\gamma-1}} - \frac{2}{M} \left[\frac{2}{\gamma+1} \left(1 + \frac{\gamma-1}{2} M^2 \right) \right]^{\frac{2}{\gamma-1}} \quad (2.9)$$

$$M^{n+1} = M^n - \frac{F}{F'} \quad (2.10)$$

Method #1: Prediction of the Pressure Distribution within a De Laval Nozzle by using Numerical Approach

2. Find pressure distribution

a. Pressure at exit is same as atmospheric pressure for shock inside nozzle ($P_e = P_{atm}$). For shock after lip of nozzle, total pressure is constant throughout the interior of the nozzle ($P_{t2} = P_{t1}$).

b. Find total pressure behind the shock:

$$P_{t2} = \frac{P_{t2}}{P_e} P_e \text{ where } \frac{P_{t2}}{P_e} = \left(1 + \frac{\gamma-1}{2} M_e^2\right)^{\frac{\gamma}{\gamma-1}} \quad (2.4)$$

c. Any pressure behind the shock is therefore:

$$P = P_{t2} \left(1 + \frac{\gamma-1}{2} M^2\right)^{\frac{-\gamma}{\gamma-1}} \quad (2.5)$$

d. Calculate P_{t1} ahead of shock:

$$P_{t1} = \frac{P_{t1}}{P_1} \frac{P_1}{P_2} \frac{P_2}{P_{t2}} P_{t2} \quad (2.6)$$

where you can use Total-Static relation for 1st and 3rd ratios, and for the middle ratio:

$$\frac{P_1}{P_2} = \frac{1 + \gamma M_2^2}{1 + \gamma M_1^2} \quad (2.7)$$

or

$$\frac{P_2}{P_1} = 1 + \frac{2\gamma}{\gamma+1} (M_1^2 - 1)$$

e. Now that you have the total pressure upstream of the shock, as well as the Mach number calculated earlier you can calculate the pressure upstream of the shock.

a. For 3rd Critical

1. $P_1 = P_2 = P_e$
2. $M_1 = M_2 = M_e$ (supersonic)

b. For 1st Critical

1. Same as 3rd critical, but M_e is subsonic

c. For 2nd Critical

1. $M_2 = M_e$
2. $P_2 = P_e$

Method #2: Prediction of the Pressure Distribution within a De Laval Nozzle by using Shock Table Method

Tap No.	Distance downstream of throat (inches)	Area (Sq. inches)

15					

- *Method #2: by using Isentropic Flow properties table (Appendix-A of Anderson's textbook)*

Method #2: Prediction of the Pressure Distribution within a De Laval Nozzle by using Shock Table Method

- By using the normal shock tables with $M_1 = 1.64$ we find that $M_2 = 0.686$. (Appendix-B of Anderson's textbook)
- Next, we find the sonic reference area behind the shock using the area-Mach relation. i.e., $M_2=0.686$ (Appendix-A of Anderson's textbook)
- Find sonic reference behind the shock using the area-Mach relationship:

$$(A_2^*)^2 = A_1^2 M_1^2 \left[\frac{2}{\gamma + 1} \left(1 + \frac{\gamma - 1}{2} M_1^2 \right) \right]^{\frac{\gamma + 1}{\gamma - 1}}$$

i.e., $A_2^* = 0.557 \text{ sq. Inches}$

- If the shockwave is located at position of tab#12:

Tap No.	A/A*	Mach #	P/P _t	P	P _g
1	1.681	0.37	0.9098		
2	1.111	0.67	0.7401		
3	1.008	0.97	0.5469		
5	1.000	1.00	0.5283		
7	1.088	1.35	0.3370		
9	1.176	1.50	0.2724		
11	1.258	1.61	0.2318		
pre-shock	1.294	1.64	0.2217		
post-shock	1.105	0.69	0.7274		
13					
15					

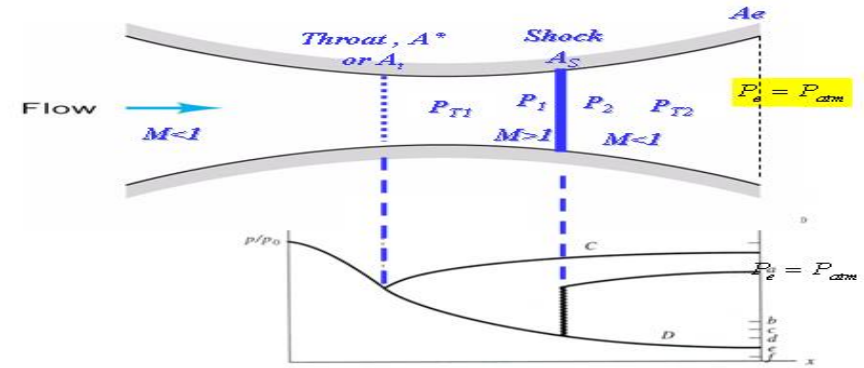

Method #2: Prediction of the Pressure Distribution within a De Laval Nozzle by using Shock Table Method

- With the exit pressure to be sea-level standard pressure. We now calculate the total pressure behind the shock using this value of exit pressure and the pressure ratio at the exit:

$$P_{t2} = \frac{P_t}{P} P = \left(\frac{1}{0.7528} \right) 14.7 = 19.53$$

- Our last major task is to find the total pressure ahead of the shock, P_{t1}

$$P_{t1} = \frac{P_{t1}}{P_1} \frac{P_1}{P_2} \frac{P_2}{P_{t2}} P_{t2}$$

Tap No.	A/A*	Mach #	P/P _t	P	P _g
1	1.681	0.37	0.9098		
2	1.111	0.67	0.7401		
3	1.008	0.97	0.5469		
5	1.000	1.00	0.5283		
7	1.088	1.35	0.3370		
9	1.176	1.50	0.2724		
11	1.258	1.61	0.2318		
pre-shock	1.294	1.64	0.2217		
post-shock	1.105	0.69	0.7274	14.21	
13	1.125	0.66	0.7465	14.58	
15	1.137	0.65	0.7528	14.7
