## AerE310: Incompressible Aerodynamics

## Homework Problem Set \#07:

## Due: 5:00pm on Friday, 05/03/2024

## Problem\#1:

A rectangular plate, whose streamwise dimension (or chord c) is 0.2 m and whose width (or span b ) is 1.8 m , is mounted in a wind tunnel. The freestream velocity is $40 \mathrm{~m} / \mathrm{s}$. The density of the air is $1.2250 \mathrm{~kg} / \mathrm{m}^{3}$, and the absolute viscosity is $1.7894 * 10^{-5} \mathrm{~kg} / \mathrm{m} \cdot \mathrm{s}$.

- Graph the velocity profiles at $\mathrm{x}=0.0 \mathrm{~m}, \mathrm{x}=0.05 \mathrm{~m}, x=0.10 \mathrm{~m}$, and $x=0.20 \mathrm{~m}$.
- Calculate the chordwise distribution of the skin-friction coefficient and the displacement thickness.
- What is the drag coefficient for the plate?

## Problem\#2:

The streamwise velocity component for a laminar boundary layer is sometimes assumed to be roughly approximated by the
linear relation

$$
u=\frac{y}{\delta} u_{e} \quad \delta=1.25 * 10^{-2} \sqrt{x}
$$ Assume that we are trying to approximate the flow of air at standard sea-level conditions past a flat plate where $u_{e}=2.337$ $\mathrm{m} / \mathrm{s}$.

- Calculate the streamwise distribution of the displacement thickness $\left(\delta^{*}\right)$, the velocity at the edge of the boundary layerlleft $\left(v_{e}\right)$, and the skin-friction coefficient $\mathrm{C}_{\mathrm{f}}$.
- Compare the values obtained assuming a linear velocity profile with the Blasius solutions.

Figure 4.7 Comparison of velocity profiles for a laminar boundary layer on a flat plate.

## Problem\#3:

A small airplane flies at speed of $90 \mathrm{~m} / \mathrm{s}$ at 1000 m altitude. The airplane wing has rectangular shape with chord length of 1 m and span of 11 m . Assume boundary layer over the wing surface is fully laminar and model the wing airfoil as a flat plate.

- a) Estimate the boundary layer thickness at the trailing edge.
- b) Estimate the displacement thickness at the trailing edge.
- c) estimate the friction drag of the wing.

## Problem\#4:

A well-hit golf ball (diameter $D=1.69 \mathrm{in}$., weight w=0.0992 lb) can travel at $U=200 \mathrm{ft} / \mathrm{s}$ as it leaves the tee. A well-hit table tennis ball (diameter $D=1.50 \mathrm{in}$., weight w= 0.00551 lb ) can travel at $U=60$ $\mathrm{ft} / \mathrm{s}$ as it leaves the paddle.

- Determine the drag on a standard golf ball, a smooth golf ball, and a table tennis ball for the conditions given.
- Also determine the deceleration of each ball for these conditions.
